## Experience

**Bright Pattern** – AI-powered voice and omnichannel contact center platform serving 500+ enterprise customers.  
*Software Engineer*

Dec 2024 – Present  
San Bruno, CA

- Built an **agentic AI test-automation framework** that QA teams use to run their acceptance suites end-to-end against the platform's **voice AI**, taking a full regression run from **4 hours to 30 minutes** and freeing over **40 hours per month** of team capacity while growing suite coverage from **0 to 32%** in 5 weeks.
- Orchestrates AI agents over **Model Context Protocol** servers to drive the agent and admin portals and originate real **SIP phone calls**, with an independent checker that queries the databases and APIs directly after every run instead of trusting what the test reports, catching runs that claim success while doing nothing. Surfaced **8 undocumented product behaviors** and caught **3 production regressions**, including a call-routing outage affecting an entire customer.
- Shipped a production **speech-to-text** pipeline that merges multi-party call audio into a single contextual stream with Silero VAD before inference, cutting transcription API cost **50%**, raising **accuracy 15%**, and extending Arabic completeness **30%** by recovering short phrases the previous approach dropped.
- Designed and shipped the first **benchmark for evaluating AI-generated tests**, scoring 17 cases across three verification styles and screening out generated tests that report a pass without actually checking anything.

## Projects

**ColdReach** – Zero to Agents (Vercel) hackathon winner; AI outreach product in public beta at [trycoldreach.app](https://trycoldreach.app)

- Shipped a **Next.js / TypeScript** product where an agent runs a multi-turn tool-use loop to find and disambiguate a verified contact, drafts three tone variants in parallel on a second model, and sends from the user's own Gmail in one click. Cut user time-to-send **85%** and per-chat inference cost **70%** through dual-model routing behind a single gateway.
- Made the product decision to gate it to one recipient per conversation rather than bulk sequencing, and collapsed onboarding to a single resume upload parsed straight into the agent's context, bringing time-to-first-draft **under 60 seconds**.

**Kit Grail** – distributed e-commerce marketplace, four-person team

- Built a **TypeScript** system of 6 backend services and 3 **React / Next.js** storefronts (shopper, seller, admin) behind an NGINX reverse proxy doing TLS termination and path-based routing, with Stripe checkout, token-based auth, and a vector search service.
- Authored **159 automated test files** (Vitest, supertest, Puppeteer) covering API contracts, authorization, payment webhooks, and failure paths against a live database rather than mocks, and built the GitLab CI pipeline fanning out to 27 jobs so every commit ran the full suite before merge.

**DailyGate** – Guild prize winner, Harness Engineering Hack (top 6 of 80); published on Guild's agent marketplace

- Built an agent that **earns autonomy** instead of being granted it: a Bayesian trust model scores each decision category from human approvals and overrides, and permission tiers are separate sandboxed agents with distinct tool grants rather than prompt rules, so a rising score routes work to a more capable agent, one override demotes it immediately, and **high-stakes categories are hard-capped and never auto-promote**.

**Pharma Trail** – Selected for ClickHouse AI Demo Night SF; regulated-industry data transparency app

- Joined two federal datasets (~**6M** industry payments × ~**2M** prescriptions across **642K** prescribers) to measure whether payments track prescribing, finding up to **+57%** against a zero-payment control; served from ClickHouse and Neon Postgres behind a Next.js front end and a public **MCP server** deployed on **Google Cloud Run**.

## Education

**University of California, Santa Cruz** GPA: 3.65/4  
*Bachelor of Science in Computer Science*

Expected Graduation: **Winter 2027**

## Technical Skills

**Frontend:** TypeScript, React, Next.js, Tailwind, TanStack Query, Recharts, responsive and mobile UX

**Backend & APIs:** Node.js, Express, TSOA (OpenAPI), Hono, FastAPI, Python, REST, WebSockets, OAuth, JWE, Stripe, Gmail API, PostgreSQL, MySQL, MongoDB, Redis, ClickHouse

**AI Systems:** multi-turn tool-use loops, agent orchestration, Model Context Protocol (MCP), model routing, Vercel AI Gateway, speech-to-text (Whisper, Silero VAD), evaluation and verification frameworks, Langfuse tracing

**Infra & Tooling:** Google Cloud Platform (Cloud Run), AWS, Vercel, Fly.io, Docker, NGINX, GitLab CI, Playwright, Vitest, Puppeteer, Git, Linux
